**Listing of Claims:**

Claim 1 (Currently Amended): In a method of etching a surface of a wafer with a microscopic roughness to prepare the wafer surface for receiving a deposition of a material on the wafer surface, the steps of

removing a thin layer from the surface of the wafer to eliminate any impurities from the surface of the wafer,

wherein the material of the thin layer is the same as the material of the remaining wafer, and

thereafter creating the microscopic roughness on the surface of the wafer to receive a deposition of the material on the surface by providing ions of an inert gas by physical RF plasma etch with an insufficient energy to etch the surface of the wafer but with a sufficient energy to create the microscopic roughness on the surface of the wafer.

Claim 2 (Cancelled)

Claim 3 (Previously Amended): In a method as set forth in claim 1 wherein the inert gas is argon.

Claim 4 (Previously Presented): In a method as set forth in claim 1  
wherein the wafer is disposed on a waferland and  
wherein a layer of chromium is deposited on the waferland after the microscopic roughness has been produced on the surface of the wafer.

Claim 5-21 (Cancelled)

TEGL-01208US0  
US Patent Application No. 10/051,886

Claim 22 (Currently Presented): In a method of providing for an attachment of an electrical component to a wafer, the steps of:

removing a thin layer from the surface of the wafer by ions of inert gas by physical RF plasma etch,

wherein the material of the thin layer is the same as the material of the remaining wafer,

thereafter providing the surface of the wafer with a microscopic roughness, thereafter depositing a layer of chromium on the microscopically rough surface of the wafer with a low intrinsic tensile stress, and thereafter depositing a layer of nickel vanadium on the surface of the wafer with a low intrinsic compressive stress.

Claim 23 (Previously Amended): In a method as set forth in claim 22

wherein a layer of a metal selected from a group consisting of gold, silver and copper is deposited on the surface of the nickel vanadium layer and wherein a component is soldered to the layer of the metal selected from the group consisting of copper, gold and silver.

Claim 24 (Previously Presented): In a method as set forth in claim 23

wherein the layer of the chromium is deposited on the microscopically rough surface of the wafer with no RF bias.

Claim 25 (Previously Presented): In a method as set forth in claim 22

wherein the layer of chromium is deposited on the microscopically rough surface of the wafer at a low rate of the flow of an inert gas.

Claim 26 (Previously Presented): In a method as set forth in claim 24

wherein the layer of chromium is deposited on the microscopically rough surface of the wafer at a low rate of flow of an inert gas and

wherein an RF bias power is applied during the deposition of the nickel vanadium layer on the chromium layer to produce the low intrinsic compressive stress in the nickel vanadium layer.

Claim 27 (Previously Amended): In a method as set forth in claim 22  
wherein the layer of the chromium is deposited on the microscopically rough surface of the wafer with no RF bias and  
wherein the layer of chromium is deposited on the microscopically rough surface of the wafer at a low rate of flow of an inert gas and  
wherein an RF bias power is applied during the deposition of the nickel vanadium layer on the chromium layer to produce the low intrinsic compressive stress in the nickel vanadium layer.

Claim 28 (Previously Amended): In a method as set forth in claim 27  
wherein a layer of a metal selected from a group consisting of gold, silver and copper is deposited on the surface of the nickel vanadium layer and  
wherein the component is soldered to the layer of the metal selected from the group consisting of copper, gold and silver.

Claim 29 (Currently Presented): In a method of providing a deposition on a surface of a wafer, the steps of:

removing a thin layer from the surface of the wafer to eliminate impurities from the surface of the wafer,

wherein the material of the thin layer is the same as the material of the remaining wafer.

creating a microscopic roughness on the surface of the wafer, and  
depositing a chromium layer with a low intrinsic tensile stress on the microscopically rough surface of the wafer.

Claim 30 (Previously Presented): In a method as set forth in claim 29  
wherein the chromium layer is deposited on the microscopically rough surface of the wafer in a chamber and

wherein an inert gas having a low flow rate is passed through the chamber with no RF bias on the wafer, when the chromium layer is deposited on the microscopically rough surface of the wafer, to prevent molecules of the inert gas from being entrapped in the chromium layer.

**Claim 31 (Previously Amended):** In a method as set forth in claim 30 wherein the inert gas is argon.

**Claim 32 (Previously Presented):** In a method as set forth in claim 30 wherein the microscopic roughness is produced on the surface of the wafer by providing the molecules of the inert gas with an insufficient energy to etch the surface of the wafer but with a sufficient energy to create the microscopic roughness on the surface of the wafer.

**Claim 33 (Previously Presented):** In a method as set forth in claim 29 wherein no RF bias is provided when the chromium layer is deposited on the surface of the wafer and wherein the chromium layer is deposited on the microscopically rough surface of the wafer in a chamber and wherein an inert gas having a low flow rate is passed through the chamber, when the chromium layer is deposited on the microscopically rough surface of the wafer, to prevent the inert gas from being entrapped in the chromium layer and wherein the inert gas is argon.

**Claim 34 (Previously Presented):** In a method as set forth in 31 wherein the wafer is disposed on a waferland and wherein a layer of chromium is deposited on the waferland, before etching the wafer surface, to prevent the layer of chromium deposited on the wafer from being contaminated by the material from the waferland.

Claim 35 (Currently Presented): In a method of preparing a wafer surface for receiving an electronic component, the steps of:

removing a thin layer from the surface of the wafer,

wherein the material of the thin layer is the same as the material of the remaining wafer,

thereafter creating a microscopic roughness on the surface of the wafer by providing ions of an inert gas by physical RF plasma etch with an insufficient energy to etch the surface of the wafer but with a sufficient energy to create the microscopic roughness on the surface of the wafer, and

thereafter depositing a chromium layer on the microscopically rough surface of the wafer in a chamber in which a minimal amount of an inert gas is passed through the chamber during the deposition to prevent molecules of the inert gas from being entrapped in the chromium layer.

Claim 36 (Previously Presented): In a method as set forth in claim 35

wherein no wafer bias is produced on the wafer when the chromium layer is deposited on the surface of the wafer.

Claim 37 (Previously Presented): In a method as set forth in claim 35

wherein the chromium layer is deposited on the surface of the wafer under tension with a low amount of stress.

Claim 38 (Previously Presented): In a method as set forth in claim 36

wherein the chromium layer is deposited on the surface of the wafer with a low amount of intrinsic tensile stress.

Claim 39 (Currently Presented): In a method of providing a deposition on a surface of a wafer for receiving an electronic component on the wafer surface, the steps of:

removing a thin layer from the surface of the wafer,

wherein the material of the thin layer is the same as the material of the remaining wafer,  
creating a microscopic roughness on the surface of the wafer, and  
atomically bonding a chromium layer to the microscopically rough surface on  
the wafer.

**Claim 40 (Previously Presented):** In a method as set forth in claim 39  
wherein the chromium layer is deposited on the microscopically rough surface  
of the wafer with no RF bias.

**Claim 41 (Previously Presented):** In a method as set forth in claim 39, the step of:  
providing a low intrinsic tensile stress in the chromium layer.

**Claim 42 (Currently Presented):** In a method as set forth in claim 39  
wherein the microscopic roughness on the surface of the wafer is provided by  
disposing the wafer in a chamber and by passing ions of an inert gas by  
physical RF plasma etch through the chamber with insufficient energy to  
etch the surface of the wafer but with sufficient energy to produce the  
microscopic roughness on the surface of the wafer.

**Claim 43 (Currently Amended):** In a method as set forth in claim 40  
wherein an intrinsic tensile stress is provided with a low value in the  
chromium layer and  
wherein the microscopic roughness on the surface of the wafer is provided by  
disposing the wafer in a chamber and by passing ions of an inert gas by  
physical RF plasma etch through the chamber with insufficient energy to  
etch the surface of the wafer but with sufficient energy to produce the  
microscopic roughness on the surface of the wafer.

**Claim 44 (Previously Presented):** In combination for performing electrical functions,  
a wafer having a clean surface with a microscopic roughness, and

TEGL-01208US0  
US Patent Application No. 10/051,886

a layer of chromium deposited on the microscopically rough surface of the wafer with a low intrinsic tensile stress in the chromium layer.

Claim 45 (Previously Presented): In a combination as set forth in claim 44 wherein the chromium layer is deposited on the microscopically rough surface of the wafer with a low intrinsic tensile stress at a rate of flow of an inert gas in the order of 3-5 SCCM.

Claim 46 (Currently Presented): In a combination as set forth in claim 44 wherein the microscopic roughness is provided on the surface of the wafer by ions of an inert gas by physical RF plasma etch with an insufficient energy to etch the surface of the wafer but with sufficient energy to produce the microscopic roughness on the surface of the wafer.

Claim 47 (Previously Presented): In a combination as set forth in claim 44 wherein an atomic bonding is produced between the chromium in the chromium layer and the microscopically rough surface of the wafer.

Claim 48 (Previously Presented): In combination for performing electrical functions, a wafer, a chromium layer deposited on the wafer with a low intrinsic tensile stress, and a layer of nickel vanadium deposited on the chromium layer in firmly adhered relationship to the chromium layer with a low intrinsic compressive stress.

Claim 49 (Previously Presented): In a combination as set forth in claim 48, the chromium layer being under the low intrinsic tensile stress and the nickel vanadium layer being under the low intrinsic compressive stress to neutralize the low intrinsic tensile stress of the chromium layer.

Claim 50 (Previously Presented): In a combination as set forth in claim 48, the chromium in the chromium layer having a low intrinsic tensile stress and an atomic bonding with the microscopically rough surface on the wafer.

Claim 51 (Previously Presented): In combination for performing electrical functions, a wafer having a clean surface with a microscopic roughness, and a chromium layer deposited on the microscopically rough surface of the wafer and atomically bonded to the microscopically rough wafer surface.

Claim 52 (Previously Presented): In a combination as set forth in claim 51, the chromium layer having a low intrinsic tensile stress for bonding to the microscopically rough wafer surface.

Claim 53 (Previously Presented): In combination for performing electrical functions, a wafer having a clean surface, a chromium layer disposed on the clean surface of the wafer with an intrinsic tensile stress, and a nickel vanadium layer deposited on the chromium layer with a low intrinsic compressive stress.

Claim 54 (Previously Presented): In a combination as set forth in claim 53 wherein the low intrinsic compressive stress of the nickel vanadium layer substantially neutralizes the low intrinsic tensile stress of the chromium layer.

Claim 55 (Previously Presented): In a combination as set forth in claim 53 wherein the clean surface of the wafer has a microscopic roughness and wherein the chromium in the chromium layer is atomically bonded to the microscopically rough surface of the wafer.

Claim 56 (Previously Presented): In a combination as set forth in claim 53,

a layer of a metal selected from the group consisting of copper, gold and silver and disposed on the nickel vanadium layer with a low intrinsic tensile stress.

Claim 57 (Previously Presented): In a combination as set forth in claim 53 wherein a layer of a metal selected from the group consisting of copper, gold and silver is deposited on the nickel vanadium layer and wherein the nickel vanadium layer substantially neutralizes any intrinsic stress in the metal layer selected from the group consisting of copper, gold and silver.

Claim 58 (Previously Presented): In a combination as set forth in claim 53 wherein an electrical component is soldered to the layer of the metal selected from the group consisting of copper, gold and silver.

Claim 59 (Previously Presented): In a method of etching a surface of a wafer with a microscopic roughness, the steps of:

providing a flow of an inert gas in the order of forty (40) to fifty (50) standard cubic centimeters per minute through a chamber containing the wafer and at a relatively high gas pressure in the order of  $4-6 \times 10^{-3}$  Torr to remove a thin layer from the surface of the wafer,

thereafter providing a flow of an inert gas through the chamber at a flow rate of approximately forty (40) to fifty (50) standard cubic centimeters per minute and a power in the order of six hundred watts (600 W) to twelve hundred watts (1200 W) to remove impurities from the surface of the wafer and provide an an atomically rough surface,

disposing the wafer on a waferland, and

then providing a flow of an inert gas at a rate of approximately 40-50 standard cubic centimeters per minute through the chamber at a low power in the order of fifty watts (50 W) to one hundred watts (100 W) to provide the surface of the wafer with the microscopic roughness.

TEGL-01208US0  
US Patent Application No. 10/051,886

Claim 60 (Previously Presented): In a method as set forth in claim 59

wherein the power applied in the chamber to remove the impurities from the surface of the wafer is in the order of 600- 1200 watts for approximately thirty (30) seconds and

wherein the flow of the inert gas through the chamber to provide the surface of the wafer with the microscopic roughness occurs for a period of approximately sixty (60) seconds.

Claim 61 (Previously Presented): In a method as set forth in claim 59

wherein a layer of chromium is deposited on the microscopically rough surface of the wafer without any RF bias and at a low flow rate of the inert gas.

Claim 62 (Previously Presented): In a method as set forth in claim 59

wherein a layer of nickel vanadium is deposited on the surface of the chromium layer with an RF bias power of approximately 300 watts and with a flow rate of argon of approximately 5 sccm.

Claim 63 (Previously Presented): In a method as set forth in claim 60

wherein a layer of chromium is deposited on the surface of the wafer and before the surface of the wafer is etched.

Claim 64 (Previously Presented): In a method as set forth in claim 60

wherein the nickel vanadium layer is deposited on the chromium layer with a power of approximately six thousand watts (6000 W), with a flow rate of argon of approximately five (5) sccm and with RF power of approximately three hundred (300) watts.

Claim 65 (Previously Presented): In a method as set forth in claim 29

wherein the chromium layer is deposited with a low intrinsic tensile stress on the microscopically rough surface by providing the layer with no RF bias.

TEGL-01208US0  
US Patent Application No. 10/051,886

Claim 66 (Currently Amended): In a method as set forth in claim 29  
wherein the microscopic roughness is created on the surface of the wafer by  
providing ions of an inert gas by physical RF plasma etch on the surface of  
the wafer with an insufficient energy to etch the surface of the wafer but  
with a sufficient energy to create the microscopic roughness on the surface  
of the wafer.

Claim 67 (Previously Presented): In a method as set forth in claim 1  
wherein the inert gas is argon and  
wherein the wafer is disposed on a waferland and  
wherein a layer of chromium is deposited on the waferland after the  
microscopic roughness has been produced on the surface of the wafer.

Claim 68 (Currently Amended): In a method as set forth in claim 22  
wherein the microscopic roughness on the surface of the layer is created by  
providing ions of an inert gas by physical RF plasma etch on the surface of  
the wafer with an insufficient energy to etch the surface of the wafer but  
with a sufficient energy to create the microscopic roughness on the surface  
of the wafer.

Claim 69 (Currently Amended): In a method as set forth in claim 39  
wherein the microscopic roughness is created on the surface of the wafer by  
providing ions of an inert gas by physical RF plasma etch on the surface of  
the wafer with an insufficient energy to etch the surface of the wafer but a  
sufficient energy to create the microscopic roughness on the surface of the  
wafer.

Claim 70 (Previously Presented): In a method as set forth in claim 1 wherein the inert gas  
pressure is about  $4 \times 10^{-3}$  Torr.

TEGL-01208US0  
US Patent Application No. 10/051,886

Claim 71 (Previously Presented): In a method as set forth in claim 1 wherein the inert gas flow is between 40 to 50 sccm.

Claim 72 (Previously Presented): In a method as set forth in claim 1 wherein the energy provided to the ions of the inert gas is between 50 to 100W.

Claim 73 (New): In a method as set forth in claim 1 wherein the microscopic roughness is an atomic-scaled roughness.

Claim 74 (New): In a method as set forth in claim 22 wherein the microscopic roughness is an atomic-scaled roughness.

Claim 75 (New): In a method as set forth in claim 29 wherein the microscopic roughness is an atomic-scaled roughness.

Claim 76 (New): In a method as set forth in claim 35 wherein the microscopic roughness is an atomic-scaled roughness.

Claim 77 (New): In a method as set forth in claim 39 wherein the microscopic roughness is an atomic-scaled roughness.

Claim 78 (New): In a method as set forth in claim 44 wherein the microscopic roughness is an atomic-scaled roughness.

Claim 79 (New): In a method as set forth in claim 51 wherein the microscopic roughness is an atomic-scaled roughness.
